Chapter 1

README

AMASP Arduino Library

This library implements the AMASP (ASCII Master/Slave Protocol) for Arduino boards, a simple way to exchange messages between two computers using serial communication.

AMASP is free and uses four different packets:

MASTER -> SLAVE:

MRP - Master Request Packet CEP - Communication Error Packet

SLAVE -> MASTER:

SRP - Slave Response Packet SIP - Slave Interruption Packet CEP - Communication Error Packet

The protocol is transparent to the user that only needs to use the AMASP Arduino Library functions to implement his own applications. See the examples codes!

AMASPArduinoLib is under test and improvements, if you have any problem using it, please send a mail to the author (Spanish, Portuguese or English) adelai@gmail.com.

Contributors will be welcome!

Wants to design an AMASP library to other platforms? Be my guest!

Documentation about AMASP available here: <https://doi.org/10.14209/jcis.2019.1>

Author:

Andre L. Delai adelai@gmail.com

Enjoy, it's free! :)

Chapter 2

Class Index

2.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

AMASPSerialMaster	5
AMASPSerialSlave	8

Chapter 3

Class Documentation

3.1 AMASPSerialMaster Class Reference

Public Member Functions

- void [begin](#) (HardwareSerial &serial)
Initializes the master connecting it to the serial link.
- void [end](#) ()
Finalizes the master disconnect it from the serial link.
- int [sendRequest](#) (int deviceId, byte message[], int msgLength)
Send a MRP (Master Request Packet).
- void [sendError](#) (int device, int errorCode)
Send a CEP (Communication Error Packet).
- PacketType [readPacket](#) (int &deviceId, byte message[], int &codeLength)
Read the incoming AMASP packet.
- PacketType [readPacket](#) (int &deviceId, byte message[], int &codeLength, ErrorCheck &eca)
Read the incoming AMASP packet.
- void [setErrorCheck](#) (ErrorCheck eca)
Sets the ECA (Error Check Algorithm).

3.1.1 Member Function Documentation

3.1.1.1 [begin\(\)](#)

```
void AMASPSerialMaster::begin (  
    HardwareSerial & serial )
```

Initializes the master connecting it to the serial link.

Parameters

<i>serial</i>	Serial communication object.
---------------	------------------------------

3.1.1.2 end()

```
void AMASPSerialMaster::end ( )
```

Finalizes the master disconnect it from the serial link.

3.1.1.3 readPacket() [1/2]

```
PacketType AMASPSerialMaster::readPacket (
    int & deviceID,
    byte message[],
    int & codeLength )
```

Read the incoming AMASP packet.

Parameters

<i>deviceID</i>	Device identification.
<i>message</i>	Message read from the associated device.
<i>msgLength</i>	Message length in bytes.

Returns

Return a PacketType enumeration (MRP, SRP, SIP, CEP or timeout). If timeout is returned, no AMASP packet was found.

3.1.1.4 readPacket() [2/2]

```
PacketType AMASPSerialMaster::readPacket (
    int & deviceID,
    byte message[],
    int & codeLength,
    ErrorCheck & eca )
```

Read the incoming AMASP packet.

Parameters

<i>deviceID</i>	Device identification.
<i>message</i>	Message read from the associated device.
<i>msgLength</i>	Message length in bytes.
<i>eca</i>	Error Check Algorithm used by the packet.

Returns

Returns a PacketType enumeration (MRP, SRP, SIP, CEP or timeout). If timeout is returned, no AMASP packet was found.

3.1.1.5 sendError()

```
void AMASPSerialMaster::sendError (
    int device,
    int errorCode )
```

Send a CEP (Communication Error Packet).

Parameters

<i>deviceID</i>	Device identification.
<i>errorCode</i>	The communication error code.

3.1.1.6 sendRequest()

```
int AMASPSerialMaster::sendRequest (
    int deviceID,
    byte message[],
    int msgLength )
```

Send a MRP (Master Request Packet).

Parameters

<i>deviceID</i>	Device identification.
<i>message</i>	Message to be send to the associated device.
<i>msgLength</i>	Message length in bytes.

3.1.1.7 setErrorCheck()

```
void AMASPSerialMaster::setErrorCheck (
    ErrorCheck eca )
```

Sets the ECA (Error Check Algorithm).

Parameters

<i>eca</i>	Error Check Algorithm.
------------	------------------------

The documentation for this class was generated from the following files:

- C:/Users/aldelai/Documents/Repositorio/arduinoamasplib/AMASPLib/AMASP.h
- C:/Users/aldelai/Documents/Repositorio/arduinoamasplib/AMASPLib/AMASPSerialMaster.cpp

3.2 AMASPSerialSlave Class Reference

Public Member Functions

- void [begin](#) (HardwareSerial &serial)
Initializes the slave connecting it to the serial link.
- void [end](#) ()
Finalizes the slave disconnect it from the serial link.
- void [sendResponse](#) (int deviceId, byte message[], int msgLength)
Send a SRP (Slave Response Packet).
- void [sendInterruption](#) (int deviceId, int code)
Send a SIP (Slave Interruption Packet).
- void [sendError](#) (int Device, int code)
Send a CEP (Communication Error Packet).
- PacketType [readPacket](#) (int &deviceId, byte message[], int &codeLength)
Read the incoming AMASP packet.
- PacketType [readPacket](#) (int &deviceId, byte message[], int &codeLength, ErrorCheck &eca)
Read the incoming AMASP packet.
- void [setErrorCheck](#) (ErrorCheck eca)
Sets the ECA (Error Check Algorithm).

3.2.1 Member Function Documentation

3.2.1.1 begin()

```
void AMASPSerialSlave::begin (
    HardwareSerial & serial )
```

Initializes the slave connecting it to the serial link.

Parameters

<i>serial</i>	Serial communication object.
---------------	------------------------------

3.2.1.2 end()

```
void AMASPSerialSlave::end ( )
```

Finalizes the slave disconnect it from the serial link.

3.2.1.3 readPacket() [1/2]

```
PacketType AMASPSerialSlave::readPacket (
    int & deviceID,
    byte message[],
    int & codeLength )
```

Read the incoming AMASP packet.

Parameters

<i>deviceID</i>	Device identification.
<i>message</i>	Message read from the associated device.
<i>msgLength</i>	Message length in bytes.

Returns

Returns a PacketType enumeration (MRP, SRP, SIP, CEP or timeout). If timeout is returned, no AMASP packet was found.

3.2.1.4 readPacket() [2/2]

```
PacketType AMASPSerialSlave::readPacket (
    int & deviceID,
    byte message[],
    int & codeLength,
    ErrorCheck & eca )
```

Read the incoming AMASP packet.

Parameters

<i>deviceID</i>	Device identification.
<i>message</i>	Message read from the associated device.
<i>msgLength</i>	Message length in bytes.
<i>eca</i>	Error Check Algorithm used by the packet.

Returns

Returns a PacketType enumeration (MRP, SRP, SIP, CEP or timeout). If timeout is returned, no AMASP packet was found.

3.2.1.5 sendError()

```
void AMASPSerialSlave::sendError (
    int Device,
    int code )
```

Send a CEP (Communication Error Packet).

Parameters

<i>deviceID</i>	Device identification.
<i>errorCode</i>	The communication error code.

3.2.1.6 sendInterruption()

```
void AMASPSerialSlave::sendInterruption (
    int deviceID,
    int code )
```

Send a SIP (Slave Interruption Packet).

Parameters

<i>deviceID</i>	Device identification.
<i>errorCode</i>	The interruption code.

3.2.1.7 sendResponse()

```
void AMASPSerialSlave::sendResponse (
    int deviceID,
    byte message[],
    int msgLength )
```

Send a SRP (Slave Response Packet).

Parameters

<i>deviceID</i>	Device identification.
<i>message</i>	Message to be send from the associated device.
<i>msgLength</i>	Message length in bytes.

3.2.1.8 setErrorCheck()

```
void AMASPSerialSlave::setErrorCheck (
    ErrorCheck eca )
```

Sets the ECA (Error Check Algorithm).

Parameters

<i>eca</i>	Error Check Algorithm.
------------	------------------------
